- Category : Shoulder
- Detail Category : Rotator cuff

Synovial Fluid Biomarkers Reflect Pre- and Postoperative Clinical Features in Rotator Cuff Tears, Independent of Tear Size

Seungmin Jeong¹, Jong Min Lee¹, Jeong-Hyun Koh¹, Doohyung Lee¹

Introduction and Background

Synovitis is a major contributor to pain and dysfunction in rotator cuff tears (RCTs), yet it remains unclear whether routine synovial fluid (SF) parameters reflect clinical features independent of tear size and patient age.

Material and Method

This prospective cohort study aimed to evaluate the associations between routine SF parameters and clinical features before and after rotator cuff repair. Preoperative glenohumeral SF was aspirated from 109 patients undergoing arthroscopic repair, and interleukin-6, total protein levels, and differential white blood cell counts were analyzed. Clinical features, including pain, active range of motion, strength, Constant score, and American Shoulder and Elbow Surgeons (ASES) score, were assessed preoperatively and at 3 and 6 months postoperatively.

Results

Associations between SF parameters and clinical features were examined after adjusting for tear size and age. Higher interleukin-6 and total protein levels were associated with greater preoperative pain and lower range of motion and Constant score, and these relationships persisted at 3 and 6 months. A higher neutrophil percentage was negatively correlated with preoperative range of motion, strength, and Constant score; with range of motion, strength, Constant score, and ASES score at 3 months; and with ASES score at 6 months. Routine SF parameters, including interleukin-6, total protein, and neutrophil percentage, were associated with poorer preoperative clinical features and remained related to early postoperative outcomes.

Conclusions

These findings suggest that routine SF parameters are linked to the clinical features of RCT, independent of cuff tear size and patient age, and may serve as practical biomarkers for predicting both preoperative and postoperative outcomes.
